Quarto

a simple example report

Mattias Villani

1. Introduction

This is an example of report from a Quarto document (with file format `.qmd`). You can look at the html or pdf version of the document to spot things you like to learn how to do in Quarto and then go to the corresponding place in the .qmd file to see how I did it.

> Quarto official help
>
> The Quarto website is very helpful for learning about Quarto. You can search (upper right corner) for specific things that you want to do in Quarto. Try for example searching for `bold` to see how you get **bold** text.

At the top of the file is the so called `YAML`, which contains the settings of the document.

2. Formatted text with markdown

Quarto documents uses a special language called **markdown** to write formatted (pretty looking) text like **bold text** or *italic text*.

You can make lists

- This is an item
- and this is another one
- the this is the last one

Or numbered lists

1. Item one
2. Item two
3. The last item

Or even lists like this:

- ☒ Computer lab 1
- ☐ Computer lab 2
- ☐ Computer lab 3

You can use footnotes. [1]

Links to webpages: markdown cheat sheet

Horizontal lines to be break up paragraphs

> and who doesn't like a little wise quote?

You can also use titles of section of different sizes:

Header 1

Header 2

Header 3

Header 4

3. Tables

Name	Title	Parking space
Mike	PhD student	No
Sarah	Professor	Yes
Deborah	Lecturer	No

4. Code and Plots

A Quarto document can mix text and computer code. You can include code that computes statistics in your documents and then have the computed statistics analyzed or plotted in the same document.

Code is written in **code chunks**. Here is chunk of R code that produces a plot:

[1] This is the footnote.

```r
n = 100
x = rnorm(n)
hist(x, main = "My little histogram")
```

Variables like `n` defined in a previous chunk can be used in a new chunk, like this:

```r
mean(x) # note how I use x from the previous code chunk
```

```
[1] -0.04598896
```

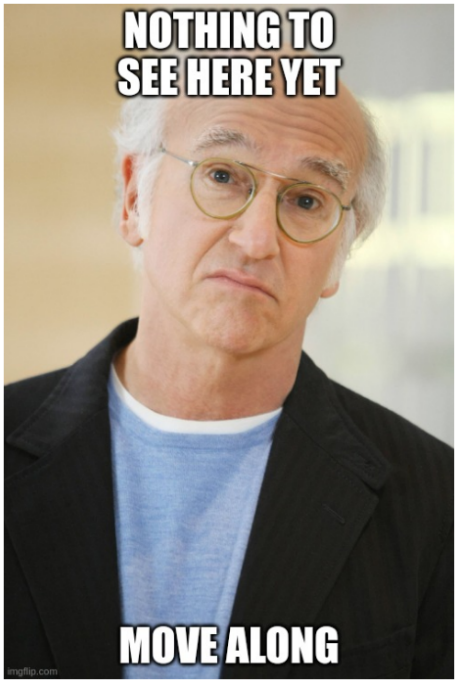
By the way, note how I used backticks ‘ ‘ on `n` above to make the font look like computer code. So I can write `plot( x ~ y, data = mydata)` to show you the plot command in the text.

You can also include other images than plots produced by R. Like this:

5. Mathematical symbols

Quarto can be used to write beautiful mathematical symbols using a very powerful typesetting system for maths called LaTeX (Strange name. Watch out, weird stuff may pop up when searching for help about LaTeX commands …). Here is some formulas that you will learn about during this course:

$$y = \beta_0 + \beta_1 x + \varepsilon, \text{ and } \varepsilon \sim N(0, \sigma_\varepsilon^2)$$



You can also write LaTeX math directly in the text: $y = a \cdot b^x$ and then just continue with the text.
